Chapter 1

Introduction

Robots become more and more often seen in our environment. Starting from nowadays standard industrial applications and ending on home appliances robots. They all have more or less user friendly interface created to program or control them. In factories can be seen most often stationary or handheld controllers and in consumer appliances, smartphone almost every time is used. Problem is that, this kind of interaction is not natural for humans. For comparison, communication between two employees working together is mostly done by voice, gestures and sometime touch. That is why modern controllers should be using these. This could improve a way of interaction on human-machine level.

A few years ago, a revolution called Industry 4.0 began which most important statement was to not replace people in factories by machines, but allow them to cooperate at production line. From that time companies are trying to simplify teaching process of robots and give them ability to sense the changing environment. Also enhancements are done on the other side. Employees are equipped with many solutions which are extending their perception. This is allowing to get better understanding what machines are doing or even see what they are "thinking".

1.1 Purpose and scope of work

This thesis will focus on Augmented Reality and their usage in modern factories and research facilities. At the beginning, different types of AR technologies will be compared to give overall view on how this is working. Then industrial or commercial products which are available right now on the market will be presented. The last part of topic studies will try to present selected solutions which are already used in real world applications.

Research part of this thesis will try to present simple examples of implementation AR in robotic applications. The topic will cover the issue of planning movement of robotic arm and also controlling and presenting data from mobile robot. This should give more or less understanding what this technology is capable of and what are its current limitations.

Chapter 2

Introduction to Augmented Reality

The perception of our surroundings is made to a large extent by the organ of sight. Thanks to that we are able to navigate and operate in our real environment. But what if we will try to trick him by placing displays in front of our eyes? Depending on content generated by computer it could simply show some additional information or create illusion of being completely somewhere else. To distinguish types of immersion the concept of a "Reality-Virtuality Continuum" was created. Its graphical representation is shown on figure 2.1.

Figure 2.1 Reality-Virtuality (RV) Continuum

{fig:RVCont

On the most left side of this line there is our real environment with real objects in no way disturbed by computer graphics. On the other hand on the most right side there is fully 3D generated world with could even in example not holding known by us laws of physics. Between two of those is everything with is mixing one part with another. Depending on what balance is, then we will talk about Augmented Reality or Augmented Virtuality. When there is more real object than virtual ones then it is AR.

2.1 Technology overview

2.1.1 Types of image projection

2.1.2 Positioning and location

2.1.3 User control and interaction

2.2 Products available on market

2.2.1 Industrial grade

2.2.2 Consumer appliances

2.2.3 Comparison

Chapter 3

Applications of Augmented Reality

Chapter 4

Research of the subject

4.1 Used technologies

4.1.1 Unity

4.1.2 Vuforia

4.1.3 Robotic Operating System

4.2 Test results

4.2.1 Robotic arm

4.2.2 Mobile robot

Chapter 5
