Chapter 1

Introduction

Robots become more and more often seen in our environment. Starting from nowadays standard industrial applications and ending on home appliances robots. They all have more or less user friendly interface created to program or control them. In factories can be seen most often stationary or handheld controllers and in consumer appliances, smartphone almost every time is used. Problem is that, this kind of interaction is not natural for humans. For comparison, communication between two employees working together is mostly done by voice, gestures and sometime touch. That is why modern controllers should be using these. This could improve a way of interaction on human-machine level.

A few years ago, a revolution called Industry 4.0 began which most important statement was to not replace people in factories by machines, but allow them to cooperate at production line. From that time companies are trying to simplify teaching process of robots and give them ability to sense the changing environment. Also enhancements are done on the other side. Employees are equipped with many solutions which are extending their perception. This is allowing to get better understanding what machines are doing or even see what they are "thinking".

1.1 Purpose and scope of work

This thesis will focus on Augmented Reality and their usage in modern factories and research facilities. At the beginning, different types of AR technologies will be compared to give overall view on how this is working. Then industrial or commercial products which are available right now on the market will be presented. The last part of the studies will try to present selected solutions which are already used in real world applications.

Research part of this thesis will try to present simple examples of implementation AR in robotic applications. The topic will cover the issue of planning movement of robotic arm and also controlling and presenting data from mobile robot. This should give more or less understanding what this technology is capable of and what are its current limitations.

Chapter 2

Introduction to Augmented Reality

2.1 Technology overview

2.1.1 Types of image projection

2.1.2 Positioning and localisation

2.1.3 User control and interaction

2.2 Products available on market

2.2.1 Industrial grade

2.2.2 Consumer appliances

2.2.3 Compare

Chapter 3

Applications of Augmented Reality

Chapter 4

Research of the subject

4.1 Used technologies

4.1.1 Unity

4.1.2 Vuforia

4.2 Test results

4.2.1 Robotic arm

4.2.2 Mobile robot

Chapter 5
